NICOTINAMIDE DERIVATIVESBackground of the Invention

This invention relates to nicotinamide derivatives that are selective inhibitors of phosphodiesterase type 4 (PDE4) and the production of tumor necrosis factor (TNF), and as such are useful in the treatment of respiratory, allergic, rheumatoid, body weight regulation, inflammatory and central nervous system disorders such as asthma, chronic obstructive pulmonary disease, adult respiratory diseases syndrome, shock, fibrosis, pulmonary hypersensitivity, allergic rhinitis, atopic dermatitis, psoriasis, weight control, rheumatoid arthritis, cachexia, crohn's disease, ulcerative colitis, arthritic conditions and other inflammatory diseases, depression, multi-infarct dementia, and AIDS.

15

This invention also relates to a method of using such compounds in the treatment of the foregoing diseases in mammals, especially humans, and to pharmaceutical compositions containing such compounds.

Since the recognition that cyclic adenosine tri-phosphate (cAMP) is an intracellular second messenger, inhibition of the phosphodiesterases has been a target for modulation and, accordingly, therapeutic intervention in a range of disease processes. More recently, distinct classes of PDE have been recognized and their selective inhibition has led to improved drug therapy. More particularly, it has been recognized that inhibition of PDE4 can lead to inhibition of inflammatory mediator release and airway smooth muscle relaxation. Thus, compounds that inhibit PDE4, but which have poor activity against other PDE types, would inhibit the release of inflammatory mediators and relax airway smooth muscle without causing cardiovascular effects or antiplatelet effects.

Recent molecular cloning has revealed a complexity and diversity of PDE4 enzymes. It is now known that there are four distinct PDE4 isozymes (A, B, C and D), each encoded for by a separate gene. Kinetic studies of human recombinant materials suggest that these four isozymes may differ in their K_m 's and V_{max} 's for hydrolysis of cAMP. Analysis of tissue distribution of PDE4 mRNAs suggests that each isozyme may be localized in a cell-specific pattern. For example, unlike human skeletal muscle human peripheral blood leukocytes do not express PDE4C message, and guinea pig eosinophils express predominantly PDE4D message. The structural and distribution diversity of PDE4 isozymes offers an opportunity to discover an isozyme selective inhibitor that blocks the function of inflammatory cells only. Using PDE4D isozyme selective inhibitors, we have demonstrated that the PDE4D isozyme plays a key role in regulating the activation and degranulation of human eosinophils. In a primate model of asthma, PDE4D isozyme selective compounds inhibit antigen-induced pulmonary eosinophilia. Therefore, by selectively blocking the D isozyme, PDE4D inhibitors exhibit reduced side effects and retain anti-asthmatic (anti-inflammatory) efficacy.

- The compounds of formula I that are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to humans or animals, it is often desirable in practice to initially isolate the compound of formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent and subsequently convert the latter free base to a pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent, such as methanol or ethanol. Upon evaporation of the solvent, the desired solid salt is readily obtained. The desired acid addition salt can also be precipitated from a solution of the free base in an organic solvent by adding to the solution an appropriate mineral or organic acid. Pharmaceutically acceptable salts of amino groups include hydrochloride (preferred), hydrobromide, sulfate, hydrogen sulfate, phosphate, hydrogen phosphate, dihydrogen phosphate, acetate, succinate, citrate, tartrate, lactate, mandelate, methanesulfonate (mesylate) and p-toluenesulfonate (tosylate) salts.
- 20
- 25
- 30
- Cationic salts of the compounds of formula I are similarly prepared except through reaction of a carboxy group, such as where R₆ is carboxy, with an appropriate cationic salt reagent such as sodium, potassium, calcium, magnesium, ammonium, N,N'-dibenzylethylenediamine, N-methylglucamine (meglumine), ethanolamine, tromethamine, or diethanolamine.

- 35 For administration to humans in the curative or prophylactic treatment of inflammatory diseases, oral dosages of a compound of formula I or a pharmaceutically acceptable salt thereof (the active compounds) are generally in the range of 0.1 to 1000 mg daily, in single or divided doses, for an average adult patient (70 kg). The active compounds can be administered in single or divided doses. Individual tablets or capsules should generally contain from 0.1 to 100 mg of active compound, in a suitable pharmaceutically acceptable vehicle or carrier. Dosages for intravenous
- 40

5 administration are typically within the range of 0.1 to 10 mg per single dose as required. For
intranasal or inhaler administration, the dosage is generally formulated as a 0.1 to 1% (w/v) solution.
In practice the physician will determine the actual dosage which will be most suitable for an
individual patient and it will vary with the age, weight and response of the particular patient. The
above dosages are exemplary of the average case but there can, of course, be individual instances
10 where higher or lower dosage ranges are merited, and all such dosages are within the scope of this
invention.

For human use, the active compounds of the present invention can be administered alone,
but will generally be administered in an admixture with a pharmaceutical diluent or carrier selected
with regard to the intended route of administration and standard pharmaceutical practice. For
15 example, they may be administered orally in the form of tablets containing such excipients as starch
or lactose, or in capsules either alone or in admixture with excipients, or in the form of elixirs or
suspensions containing flavoring or coloring agents. They may be injected parenterally; for
example, intravenously, intramuscularly or subcutaneously. For parenteral administration, they are
best used in the form of a sterile aqueous solution which may contain other substance; for example,
20 enough salts or glucose to make the solution isotonic.

Additionally, the active compounds may be administered topically when treating
inflammatory conditions of the skin and this may be done by way of creams, jellies, gels, pastes, and
ointments, in accordance with standard pharmaceutical practice.

The therapeutic compounds may also be administered to a mammal other than a human.
25 The dosage to be administered to a mammal will depend on the animal species and the disease or
disorder being treated. The therapeutic compounds may be administered to animals in the form of a
capsule, bolus, tablet or liquid drench. The therapeutic compounds may also be administered to
animals by injection or as an implant. Such formulations are prepared in a conventional manner in
accordance with standard veterinary practice. As an alternative the therapeutic compounds may be
30 administered with the animal feedstuff and for this purpose a concentrated feed additive or premix
may be prepared for mixing with the normal animal feed.

The ability of the compounds of formula I or the pharmaceutically acceptable salts thereof to
inhibit PDE₄ may be determined by the following assay.

Inhibition of Eosinophil Degranulation and Activation in Human Whole Blood

35 Human Blood Eosinophil Degranulation and Activation Measurement

Blood collection and compound incubation

One hundred ml blood is obtained from normal volunteers in Vacutainer tube #6480 (14.3
USP units sodium heparin/ml blood). Heparinized blood is pooled in 50 ml conical centrifuge
tubes at 22°C. One ml blood is placed in a 12X75 mm siliconized glass tube containing 1 ul DMSO
40 or 1 ul test compound in triplicate. After mixing, tubes are placed in a shaking water bath at 37°C

- 5 for 15 minutes. One ul PGE1 in DMSO is added to all tubes to give a final concentration of 1 uM. After mixing, 100 ul PBS (negative control) or Sephadex G-15 beads in PBS (8.25-16.5 mg/ml final concentration) is added to tubes. After mixing, all tubes are incubated in a shaking water bath at 37°C for 1-2 hours.

Preparation of plasma samples

- 10 At the end of incubation, 20 ul of 15% EDTA in PBS is added to each assay tube. After mixing, the samples are centrifuged at 2,000 rpm (Sorvall 6000B centrifuge) at 22°C for 5 minutes.

EDN (or EPX) and LTE4 measurements and the effect of compounds

- 15 All plasma samples are tested for EDN (eosinophil derived neurotoxin) and LTE4 (leukotriene E4) levels. Extensive studies suggest that Sephadex beads trigger eosinophil-mediated EDN and LTE4 release in human whole blood. The levels of EDN and LTE4 are determined by a RIA (Kabi Pharmacia Diagnostics) and EIA (Cayman Chemical), respectively. EDN and LTE4 levels are calculated by comparison to a standard curve using Microsoft Excel or other appropriate software. Percent of control EDN or LTE4 release is calculated by:

20

$$\% \text{ Control EDN} = [\text{EDN (compound)} - \text{EDN(blank)}] / [\text{EDN(total)} - \text{EDN(blank)}]$$

$$\% \text{ Control LTE4} = [\text{LTE4(compound)} - \text{LTE4(blank)}] / [\text{LTE4(total)} - \text{LTE4(blank)}]$$

- 25 where the blank is the level of EDN or LTE4 in the absence of Sephadex beads and the total is the level of EDN or LTE4 in the presence of Sephadex beads. An IC₃₀ or IC₅₀ value is defined as the concentration of a compound that inhibits specific EDN or LTE4 release by 30 or 50%, respectively.

Inhibition of PDE4 isozyme and eosinophil activation by (+) and (-) enantiomers

- 30 To assess pharmacologically which PDE4 isozyme(s) is responsible for eosinophil activation, we have prepared enantiomers of PDE4 inhibitors and compare the inhibitory effect of these enantiomers on PDE activity and eosinophil activation. PDE4 activity is assessed by measuring hydrolysis of 1 uM cAMP by individual human recombinant PDE4 isozymes (PDE4A, 4B, 4C or 4D). Eosinophil activation is estimated by measuring Sephadex beads-induced release of eosinophil derived neurotoxin (EDN) and leukotriene E4 in human whole blood. Table 1
- 35 illustrates comparison of one example of (-) and (+) enantiomers on the activity of individual PDE4 isozymes and on the release of EDN and LTE4. (+) Enantiomer ((S)-(-)-2-(4-Fluorophenoxy)-N-[1-(4-methoxy-phenyl)-ethyl]-nicotinamide) is 22 times more potent in inhibiting PDE4D than (-) enantiomer ((R)-2-(4-Fluorophenoxy)-N-[1-(4-methoxy-phenyl)-ethyl]-nicotinamide); however, they are approximately equipotent in inhibiting the other 3 isozymes, i.e.,
- 40 PDE4A, 4B and 4C. Importantly, the (+) enantiomer is 20-37 fold more effective against the EDN

- 5 and LTE4 response. These results indicate that the differential effect of (+) and (-) enantiomers on PDE4D isozyme inhibition is identical to their effects on eosinophil EDN/LTE4 release, demonstrating that the PDE4D isozyme plays a key role in regulating eosinophil.

Table 1.

(+) vs. (-) enantiomers on PDE4 Isozymes and Eosinophil Responses

	Isozyme - IC ₅₀ , uM				HWB Eosinophil IC ₃₀ or IC ₅₀ , uM	
	4A	4B	4C	4D	EDN	LTE4
(+) Enantiomer	0.6(3)	0.6(3)	7.8(1)	0.009(3)	0.05(2)	0.008(2)
(-) Enantiomer	0.6(3)	0.3(3)	2.4(4)	0.2(3)	1.0(1)	0.3(2)
(+) vs. (-)	n.s.	0.5X	-0.5X	22X	20X	37X

10

Including the aforementioned enantiomer, a total of 8 pairs of (+) and (-) enantiomers has been prepared. As illustrated in Table 2, the enantioselective effect of these compounds on PDE4D isozyme inhibition correlates significantly with those on the EDN and LTE4 response.

- 15 Table 2. Correlation of enantioselective effects on the PDE activity and EDN/LTE4 response by 8 compounds, each having (+) and (-) enantiomers.

Correlation of differential effects of (+) and (-) enantiomers on:		
	vs. END response	vs. LTE4 response
PDE4A	No correlation	No correlation
PDE4B	No correlation	No correlation
PDE4C	No correlation	No correlation
PDE4D	Positive correlation (p<0.02)	Positive correlation (p<0.005)

Inhibition of pulmonary eosinophilia

- 20 To evaluate these compounds for pulmonary efficacy, we have used a well-characterized monkey model of asthma (Turner et al., Am. J. Respir. Crit. Care Med. 149, 1153-1159, 1994). Exposure of atopic *Macaca fascicularis* monkeys to antigen causes a significant influx of inflammatory cells observed in the bronchoalveolar (BAL) fluid of these monkeys at 4-24 hours post antigen challenge. In this model, PDE4D isozyme selective compounds given
- 25 subcutaneously significantly inhibit pulmonary eosinophil infiltration by 59-76% at 24h post antigen challenge. These compounds, however, do not affect neutrophil or lymphocyte infiltration, demonstrating selective inhibition of the eosinophil response by these compounds.

Inhibition of TNF Production in Isolated Human-Monocytes

- 30 The ability of the compounds I or the pharmaceutically acceptable salts thereof to inhibit the production TNF and, consequently, demonstrate their effectiveness for treating disease involving the production of TNF is shown by the following in vitro assay:

5 Peripheral blood (100 mls) from human volunteers is collected in
ethylenediaminetetraacetic acid (EDTA). Mononuclear cells are isolated by FICOLL/Hypaque and
washed three times in incomplete HBSS. Cells are resuspended in a final concentration of 1×10^6
cells per ml in pre-warmed RPMI (containing 5% FCS, glutamine, pen/step and nystatin).
Monocytes are plated as 1×10^6 cells in 1.0 ml in 24-well plates. The cells are incubated at 37°C
10 (5% carbon dioxide) and allowed to adhere to the plates for 2 hours, after which time non-adherent
cells are removed by gentle washing. Test compounds (10ml) are then added to the cells at 3-4
concentrations each and incubated for 1 hour. LPS (10ml) is added to appropriate wells. Plates are
incubated overnight (18 hrs) at 37°C. At the end of the incubation period TNF was analyzed by a
sandwich ELISA (R&D Quantikine Kit). IC₅₀ determinations are made for each compound based on
15 linear regression analysis.

- 5 Mass spectra were determined by the GC-MS, AMPI, APCI or thermospray method.
All ^1H NMR were taken on a 400 MHz instrument.
